

What is claimed is:

[Claim 1] A concealed nozzle for ejecting fluids through thin flexible surfaces to which an attachment is made comprising a flange which contains a fluid dispersal chamber whereby only a pin hole is made in said thin surface to provide for fluid ejection, and a tube coupling which is oriented parallel to said surface and which is one part with said flange whereby a burst of fluid flows into said coupling from attached flexible tubing, and then feeds through said coupling into said water dispersal chamber and thereafter through said pin hole, ejecting fluid into the air from an unexpected location because the entire device is hidden from view.

[Claim 2] A concealed fluid burst device for use with remotely located nozzles comprising a hand held fluid reservoir which contains a pump being activated by a trigger creates a fluid burst which travels through a tube attachment coupling which exits the reservoir for the purpose of fitting a length of flexible tubing which leads to a remotely located nozzle which is concealed behind a thin flexible surface, and with said fluid burst device being concealed in the hand thereby providing fluid ejection from an unexpected location.

[Claim 3] A promotional gimmick utilized in conjunction with other products to aid in an increased marketing ability where said other products include but are not limited to: garments, photographs, illustrated pictures, or paintings; and the gimmick utilized for increased marketability is a fluid emitting device comprising a hand held fluid reservoir containing a finger activated pump providing a burst of fluid which travels through flexible tubing with sufficient length to reach a desirable point; where a miniature low profile fluid dispensing nozzle is attached to a thin surface such as fabric, and a pin hole is made in said thin surface for dispensing said fluid.

[Claim 4] The concealed nozzle in Claim 1 with an attachment means through mechanical bonding which includes sewing and crimping with a fastener.

[Claim 5] The concealed nozzle in Claim 1 with an attachment means whereby a chemical means is implemented which would include gluing and heat setting techniques.

[Claim 6] The novelty squirting device in Claims 1, 2 and 3 with the utilization of a garment to provide a thin surface to conceal said squirting device.

[Claim 7] The novelty squirting device in Claims 1, 2 and 3 with the utilization of photographs, paintings, and illustrated pictures to provide a thin surface to conceal said squirting device.
